# Powfolio

A public record of Web3 work

October 2026

## 1. The problem

Most people who work in Web3 do not have a single place that holds the record of what they have done. Trades are scattered across screenshots and private chats. Writing lives on X, Medium, or personal blogs. Community roles sit inside Discord servers that outsiders cannot easily inspect. Onchain activity is visible only if someone knows which wallet to check and which explorer to open. Airdrop participation and collectibles are even harder to surface cleanly.

When a founder, collaborator, or hiring manager wants to understand someone’s track record, they receive a handful of links and must reconstruct the picture themselves. Traditional resumes list titles and dates. They do not show the density of actual work: documented trades with context, published analysis, sustained community contribution, or a wallet footprint that can be reviewed. The gap is not the absence of work. It is the absence of a durable, public, and structured place that holds it.

## 2. What Powfolio is

Powfolio is a public profile that collects different kinds of Web3 work into one page under a single URL. A person creates an account, chooses a username, and receives a permanent address. They then add entries in the sections that apply to them. Each section can be made public when the owner decides the content is ready. The resulting page is readable by anyone with the link, including people who do not have a Powfolio account.

The page is not a feed and not a social graph. It is a structured record the owner maintains. Readers open it to see the evidence, not a claim. The owner controls visibility. Private notes stay private. A downloadable CV can be generated from the same underlying data for situations that still require a conventional document, but the public page remains the primary record.

## 3. The two scores

Two scores appear on every public profile.

- Profile Score measures how complete and clear the profile itself is. It moves when the owner fills in core fields, adds a clear bio, connects relevant links, and turns sections on.

- Builder Score measures the density of real evidence. It moves when the owner adds trades with context, writing, community roles, airdrops, collectibles, and onchain data that can be reviewed.

Neither score is a claim of income, verified returns, or official credentials. They are indicators of completeness and evidence density on that specific page. They update when the owner adds or changes entries. They do not update on slogans or empty fields.

## 4. The proof sections

The page is organized into sections that reflect the kinds of work people actually do in Web3:

- Writing and research: threads, articles, research notes, and longer pieces, with links where useful.
- Trading record: documented trades with context, updates, and outcomes. The owner can add images and notes.
- Community roles: projects, organizations, or communities the person has contributed to, with role, dates, and a short description of the work.
- Airdrops and campaigns: participation, wins, and related activity.
- Collectibles: NFTs and other onchain items the owner chooses to display.
- Onchain footprint: wallet addresses the owner has connected. Public explorer data is fetched and stored so the footprint can be viewed without the reader needing to connect a wallet or have an account.

Work experience and education sit alongside these sections. Logos can be pulled from project or school websites when the owner provides a link, or uploaded manually. Documents can be attached and shown as thumbnails. The owner decides which sections appear on the public page.

## 5. Public and private data

Anything the owner marks public is visible on the profile URL to anyone who opens it. Login email can be shown or hidden once a second email is added. At least one contact method remains available. Wallet addresses connected for onchain display are public by design because the point of the section is a reviewable footprint.

Documents attached for the CV are not automatically public. Private notes stay private. The product never asks for seed phrases, private keys, or exchange passwords. Onchain data shown on the page comes from public explorers and is stored so readers can view it without connecting a wallet themselves.

## 6. Who uses it

Powfolio is built for people who already produce Web3 work and want one durable link that holds it: traders who document calls, researchers and writers, community leads and moderators, airdrop hunters, builders, and onchain analysts. It is also useful for founders and teams who need a clearer

way to review contributors before bringing them into a project.

A later explore view will let people filter public profiles by skills, location, remote availability, and other criteria. That view is a search and discovery layer over public records. It is not a booking system and does not take a cut of work.

## 7. Current status

Public profiles are live at powfolio.xyz. Users can create pages, add entries across the supported sections, connect wallets for onchain display, generate a CV, and share the resulting link. Authentication works with email, Google, X, GitHub, and wallet. The domain is live. Legal pages exist. An operations dashboard handles reports, appeals, and audit logs.

Remaining work before a wider public push includes final security hardening, operational email on the domain, and enough real profiles that any future directory or explore view does not look empty. The product is usable today for people who want one link that holds their Web3 work. Wider visibility and the explore view come after the remaining operational items are closed.

## 8. What comes next

Near-term work is operational and security-focused: finishing domain email, confirming remaining access controls, and collecting real profiles. After that, the explore view will let people search and filter public profiles by skills, location, and other criteria. Documentation for users will be published at a dedicated subdomain once the product surface is stable. The white paper will be updated as the product changes.

Powfolio is a public record the owner maintains. Readers open the link and see the work. The owner decides what is shown. The scores move with evidence. That is the product.
